The Metabolomix+ profile identifies complex nutritional insufficiencies

US based Genova Diagnostics introduces a new collect-at-home nutritional test to help support telemedicine practices and provide clinicians a more comprehensive set of options without a blood draw.

The Metabolomix+ profile is a unique combination of nutritional tests that assess the functional need for antioxidants, B-vitamins, minerals, digestive support and amino acids with add-on modules based on a patient’s unique needs.

Add-on modules include bloodspot essential and metabolic fatty acids, toxic and nutrient elements, as well as genomics.

The Metabolomix+ profile identifies complex nutritional insufficiencies that may underlie chronic conditions and helps inform a treatment plan to optimize health outcomes.

Testing can assist in evaluation of many areas including fatigue, mood disorders, dietary guidance, athletic performance, weight loss and digestive complaints.
